

Links and Anchor Tag in HTML

Hyper Text in HTML

"**Hypertext**" refers to links that connect web pages to one another, either within a single website or between websites.

Links are a fundamental aspect of the Web. By uploading content to the Internet and linking it to pages created by other people, you become an active participant in the World Wide Web.

The Anchor Tag

The `<a>` HTML element (or anchor element), with its href attribute, creates a hyperlink to web pages, files, email addresses, locations in the same page, or anything else a URL can address.

The href attribute

The URL that the hyperlink points to. Links are not restricted to HTTP-based URLs — they can use any URL scheme supported by browsers:

- Sections of a page with fragment URLs
- Telephone numbers with tel: URLs
- Email addresses with mailto: URLs
